

Are you looking for a more efficient and safer way to manage immunization and med administration workflows?

EHR Barcode Reader

EHR Barcode Reader is an add-on application that streamlines the collection and documentation of vaccinations and medications administered directly into your NextGen® Enterprise EHR.

Quickly and easily capture vaccine data directly into Enterprise

- > **Integrated:** seamless integration into Enterprise
- > **Efficient:** automatically records vaccine and medication data fields including NDC, Expiration and Lot #
- > **Improved Workflow:** allows grouping of multiple immunization orders into a single click in Enterprise
- > **Cost Effective:** utilizes standard inexpensive 2D barcode technology which is readily available
- > **Customizable:** allows customized default fields such as Immunization Registry Fields, Dose, Units, Series, Route, Manufacturer Site, VIS, etc.
- > **Quality Information:** reduces human error by improving data quality during vaccine entry

The National Childhood Vaccine Injury Act (NCVIA) requires documentation of vaccine product identification and lot number, but manual entry of this information is often incorrect or incomplete. Fortunately, vaccine vials now have 2D barcodes containing all the information needed for documentation.

The EHR Barcode Reader captures vaccine and medication data from the 2D barcode and immediately populates key fields required by Enterprise, including the National Drug Code (NDC), lot and expiration date. This reduces documentation errors and improves vaccine or medication workflows.

This cost and time saving Enterprise add-on provides the most efficient approach to the vaccine and medication administration process. The EHR 2D Scanner App is the perfect addition to any medical practice seeking to improve the quality of care for patients.

EHR Barcode Reader

EHR Barcode Reader Immunization Home Page

The home page displays each immunization order that is currently in a "Hold For" – administration status in Enterprise. It also offers an "Immunization Groups" section for a user to generate groups of immunization orders.

Eg. Pediatric 2 Month Old – Order can be placed for Prevnar, Pediarix, Rotovirus and HIB with one click.

Immunization Details Screen

This screen displays the immunization documentation details. The cursor defaults to the Scanner field in preparation for the user to scan the barcode on the vial. Any additional details can be added to this screen. Once it has been saved, the order will now be a completed order within Enterprise.

EHR Barcode Reader Med Admin Home Page

The home page displays each Med Admin order that is currently in a "Hold For" – administration status in Enterprise. It also offers a "Medication Items" section where the user can order and administer a medication with a single click.

Med Admin Details Screen

The Medication Administration details screen displays all documentation about the medication that was ordered. The Scanner field allows the user to scan the barcode on the vial and the data will flow in. When the medication is saved, the medication order will now be a completed medication within Enterprise.
