

Are you looking for a more efficient and safer way to manage immunization and MedAdmin workflows?

EHR Barcode Reader for NextGen® Enterprise EHR

Next Level Vaccine Management

The Order completion workflow for immunizations and medications is time-consuming and often results in data entry errors and/or inaccurate data. EHR Barcode Reader saves time and reduces data entry risks by integrating barcode scanning technology directly into your Immunization and MedAdmin Order completion workflow.

Rather than manually entering all the data required to successfully complete an Order, your staff scans that data using the Barcode Reader template. The vial's barcode provides the Lot #, Expiration, and NDC #, and the custom scan sheets provide barcode values for the Manufacturer, Units and Sites and other values.

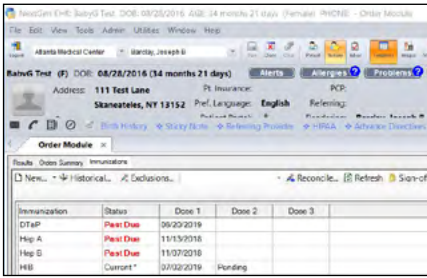

Integrated with the NextGen Orders and Inventory modules, EHR Barcode Reader improves Order completion workflow.

EHR Barcode Reader functionality Includes:

- NDC format logic to accommodate the proper '0' position
- VIS and VFC functionality
- Required field validations
- Inventory module integration of default values and count adjustment
- Monthly Scan Audit Reports

Launch EHR Barcode Reader

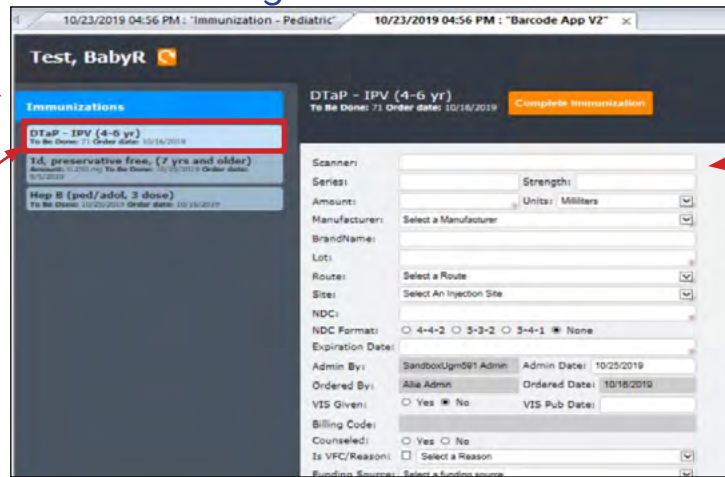

1. The EHR Barcode Reader template launches from within the Orders Module
2. User & patient context is securely passed to the Barcode Reader application
3. The Barcode Reader window automatically lists the pending Orders.

Select a Pending Order

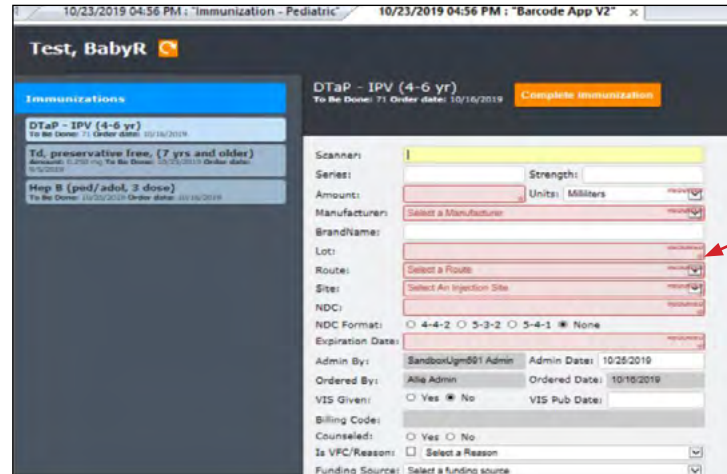

1. Pending Orders populate

2. Select Any Order

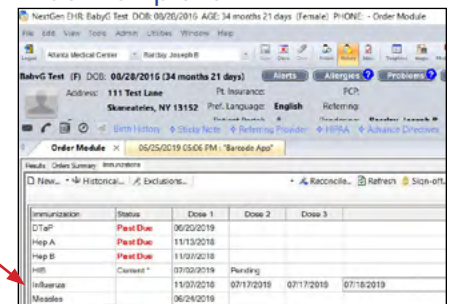

3. Form is populated with default and patient related data

Validations

Messages for required fields, expired vials, and other user warnings ensure that Orders are completed properly

Order Completion

Barcode data is integrated into the order module
